Guided Imagery for Pain Control

Peggy Burhenn, MS, CNS, AOCNS®, Jill Olausson, RN, MSN, CDE, Griselda Villegas, RN, OCN®, and Kathy Kravits, MA, RN, HNB-BC, LPC, NCC, ATR-BC

Material and Methods

Seven nurses responded to an email invitation and volunteered to participate in the pilot. The project was undertaken in the Division of Nursing Research and Education, City of Hope National Medical Center in Duarte, CA. The authors took full responsibility for the content of the article. The authors did not receive honoraria for this work. No financial relationships relevant to the content of this article have been disclosed by the authors or editorial staff. Burhenn can be reached at pburhenn@coh.org, with copy to editor at CJONEditor@ons.org.

Evidence-based practice is integral to the delivery of effective and efficient nursing care. However, translating evidence into practice remains a challenge in health care. To overcome this challenge, the Oncology Nursing Society developed a program, the ONS Foundation Institute for Evidence-Based Practice Change, to provide nurses with the tools they need to translate evidence-based practice to their units. This article reviews the process of implementing the evidence-based practice of guided imagery for pain management on a medical oncology inpatient unit at a comprehensive cancer center.

Problem Identification

Managing pain is a top priority for oncology nurses. Pain medications, as a single mode of therapy, may fail to eliminate pain; a combination of approaches is needed for relief (Gatin & Schultmeister, 2007). Therefore, adjunct methods are frequently recommended (Pasero & McCaffery, 2011). The policy and procedure on pain control for the authors’ institution notes, “Use non-drug interventions such as exercise, positioning, heat/cold, music, imagery, etc., as part of the pain relief program” (City of Hope, 2013, p. 4). To evaluate how well pain is managed, the authors conducted a periodic pain survey throughout the year of 2012. As a part of this survey, inpatients were interviewed and asked questions about how well their pain was managed while in the hospital, and the survey showed that 42% of patients were offered non-medication options for pain relief. This question prompted interest in offering guided imagery to patients. When asked why alternative methods were not being offered, some nurses stated that they were aware of other methods to control pain but were uncertain of how to implement them. Nurses expressed a desire to learn about alternative modalities. Recognizing this knowledge deficit as a barrier to evidence-based practice, the authors developed the pilot program described in the current article.

Methods

The authors’ aim was to test the feasibility of a nurse-led guided imagery intervention on two medical oncology inpatient units. Seven nurses responded to an email invitation and volunteered to participate in the pilot. The project
