Patients at highest risk for tumor lysis syndrome (TLS) often are diagnosed with bulky, rapidly proliferating hematologic tumors, such as acute leukemia and non-Hodgkin lymphoma (Kaplow & Hardin, 2007). Patients with solid tumors, such as mediastinal masses which are highly sensitive to chemotherapy, also may develop TLS, although it is more common in patients undergoing treatment for leukemia and lymphoma. TLS occurs from the effect of chemotherapy or radiation on rapidly dividing cells. Patients with elevated lactic dehydrogenase (LDH), dehydration, and renal insufficiency are at greatest risk for developing TLS (Brant, 2002). Advances in cancer treatment, such as those in bone marrow transplantation, require the use of high-dose chemotherapy, which may demonstrate an increase in the incidence of TLS.

TLS is a rapidly developing oncologic emergency characterized by electrolyte and metabolic disturbances that are fatal without timely identification and management. Patients present with hyperuricemia, hyperphosphatemia, hypocalcemia, and hyperkalemia. Hyperuricemia occurs when the liver converts nucleic acids into uric acid; hypocalcemia develops as serum calcium binds to elevated amounts of phosphorus within the bloodstream (Kaplow & Hardin). Hyperkalemia causes nausea, vomiting, and diarrhea (Cope, 2004). Anorexia, abdominal cramping, and pain also may occur because of the elevated potassium (McCance & Heuther, 2006). Decreased levels of serum calcium may cause intestinal cramping and increased bowel activity (McCance & Heuther).

Gastrointestinal

Hyperkalemia causes nausea, vomiting, and diarrhea (Cope, 2004). Anorexia, abdominal cramping, and pain also may occur because of the elevated potassium (McCance & Heuther, 2006). Decreased levels of serum calcium may cause intestinal cramping and increased bowel activity (McCance & Heuther).

Cardiac

Serum potassium levels more than 5.3 mEq/l may cause irregular heart arrhythmias and hypotension (Murphy-Ende & Chernecky, 2002). Often the dysrhythmias are atrial in origin (Kaplow & Hardin, 2007). Hyperkalemia causes electrocardiogram changes such as tall T waves, widened QRS complexes, and depressed ST segments (Murphy-Ende & Chernecky). The presence of a prolonged QT interval may indicate hypocalcemia.

Gastrointestinal

Hyperkalemia causes nausea, vomiting, and diarrhea (Cope, 2004). Anorexia, abdominal cramping, and pain also may occur because of the elevated potassium (McCance & Heuther, 2006). Decreased levels of serum calcium may cause intestinal cramping and increased bowel activity (McCance & Heuther).

Neuromuscular

Hyperkalemia causes neuromuscular irritability, muscle weakness, or paralysis, and hypocalcemia causes neuromuscular excitability (McCance & Heuther, 2006). A decreased level of serum calcium also may cause seizures and tetany (McCance & Heuther).

Medical Management

To prevent morbidity and mortality, early recognition and management of TLS are of primary concern. Patients at
